# Wonder-Wand Tunable Counterpoise System

The Wonder-Wand TCS is a portable ground radial system designed to plug into the 4mm socket on the side of the Wonder-Wand antenna, although it will also work very well with other types of antenna, providing an effective ground. Quite simply it is a tuning box that interfaces the chassis of the radio to a short 4m counterpoise which is extended out over the ground. The best setting is determined by rotating the control from A - L until a definite increase in received signal is heard. It also has the same effect on transmit.
